A Final Year Project-III Report
Presented to
AIR University
in partial fulfillment of the requirements
for the Degree of

Bachelor of Computer Engineering

AI CHATBOT FOR UNIVERSITY ADMISSION

SUBMITTED BY
MUHAMMAD MOBEEN TAHIR 191210
AREEJ GUL 191213

SPRING-2023

**DEPARTMENT OF ELECTRICAL & COMPUTER
ENGINEERING**

June 2023

Approval for Submission

It is to certify that the project report titled
" AI CHATBOT FOR UNIVERSITY ADMISSION "
has met the required standard for submission
in partial fulfillment of the requirements
for the award of degree of
Bachelor of Computer Engineering
at Air University, Islamabad.

Project Supervisor

USMAN HAMEED
Assistant Professor

Head of Department

Dr. Ashiq Hussain

ABSTARCT

This report outlines the development of a chatbot for university admission using Rasa natural language processing (NLP) and machine learning algorithms. With the increasing demand for 24/7 customer support, organizations have been turning to chatbots as a cost-effective and efficient solution. Our proposed study aims to replace traditional customer support models with an intelligent chatbot that can serve as a virtual helpdesk for university-related queries. To build the chatbot, we collected data on user demands and interactions and used machine learning algorithms to train the model. We experimented with several popular algorithms, including Decision Trees, Support Vector Machines, and Random Forest, to find the best-performing model. Our results show that Random Forest outperforms the other algorithms for university admission purposes, responding well to both normal and even spun text. The chatbot can assist users with university-related queries, including admission schedules, fee structures, offered programs, and other relevant information. The model can guide users through the university website, provide relevant links, and reduce the traffic to physical admission offices. Using Rasa NLP and dialog flow, the chatbot can understand natural language and engage in a conversation with users. The NLP toolkit enhances the chatbots ability to interpret user queries and provide relevant responses. The proposed chatbot is a cost-effective and efficient solution for universities, as it can reduce the workload on support staff and improve communication with students. The proposed chatbot for university admissions purposes has the potential to revolutionize the way universities interact with students. By leveraging the power of Rasa and machine learning, we have developed an intelligent chatbot that can assist students queries and provide a seamless user experience.

Chapter 1

INTRODUCTION

1.1 The Importance of Project

In today's world, customer support services are in high demand, and organizations must ensure that their support centers are available 24/7 to cater to the needs and demands of their customers. However, this increases the cost of human resources, as people have to work round the clock to provide uninterrupted support services. In an effort to reduce costs and time, many organizations are seeking to automate their support processes. The proposed study aims to provide a solution to this problem by developing a chatbot that can handle support and help requests in universities. The use of a chatbot can reduce the workload of human resources and provide a more efficient and cost-effective way of delivering support services to students and visitors to the university. The chatbot can be used to provide assistance and guidance related to university websites, admission procedures, and other university-related matters. The data collected from user interactions can be used to train the chatbot using machine learning algorithms, such as Decision Trees, Support Vector Machines [1], and Random Forests. Based on the results of our study, the Random Forest algorithm was found to be the most effective in handling university-related support queries. It outperformed both the Decision Tree and Support Vector Machine algorithms in terms of response time and accuracy. The chatbot can be used to guide visitors to the university website and provide links to relevant information, reducing the need for physical visits to the admission office.

By implementing the proposed chatbot, universities can significantly reduce the

workload of their support centers and improve their communications with students and visitors. The chatbot can provide support and guidance 24/7, which can increase the satisfaction levels of students and visitors. Moreover, the use of machine learning algorithms can enable the chatbot to learn from previous interactions, thereby improving its performance over time. Overall, the proposed study provides a viable solution to the problem of increasing costs and time associated with human resources in support centers. The use of a chatbot can significantly reduce these costs and provide an efficient and cost-effective way of delivering support services in universities. By implementing the proposed chatbot, universities can improve their communications with students and visitors, and reduce the need for physical visits to the admission office.

1.2 Chatbot

1.2.1 What is Chatbot

A chatbot is an artificial intelligence (AI) system designed to mimic human conversation and interact with users via text or voice [2]. Chatbots use natural language processing (NLP) to understand and respond to user inputs. The communication between a chatbot and a user is usually in a back-and-forth manner, similar to a game of tennis. Chatbots can be built using different techniques, such as AIML, retrieval-based models, and generative models. AIML is a popular and relatively straightforward approach to building chatbots. Retrieval-based models use a database of predefined responses and an algorithm to choose the most suitable response based on the input and context. Generative models, on the other hand, use machine learning techniques to generate responses based on the input and context. [3] The history of chatbots dates back to 1964 when the first chatbot, ELIZA, was created. Over the years, chatbots have evolved to become more sophisticated and capable of handling a wide range of user cases. Nowadays, chatbots are commonly used in customer service, information acquisition, and other related purposes. The classification of chatbots can be based on three dimensions. The first dimension is "building approaches," which distinguishes between retrieval-based models and generative models. Retrieval-based models are easier to build and do not make grammatical mistakes, but they are unable to handle unseen cases where no predefined response exists [4]. Generative models, on the other hand, are capable of generating responses based on machine learning techniques. The second dimension is related to the level

of intelligence of chatbots. Simple chatbots use predefined responses to user inputs, while more advanced chatbots use machine learning techniques to improve their responses based on previous interactions with users. The third dimension is related to the level of autonomy of chatbots, which can be fully automated or supervised by a human operator. Chatbots have many applications in various industries, such as healthcare, finance, and education. In healthcare, chatbots can be used for patient engagement and education, while in finance, chatbots can be used for financial advice and support. In education, chatbots can be used as intelligent tutors to assist students with their studies. In conclusion, chatbots are an important AI technology that can improve communication and engagement with users. As technology continues to advance, chatbots will become even more sophisticated and capable of handling complex user cases.

1.2.2 Types of Chatbot

There are two Main types of Chatbot:

- Rule Based Chatbot.
- AI Based Chatbot.

1.2.2.1 Rule Based Chatbot

Rule-based chatbots, also known as decision tree bots, employ a set of predefined rules to determine the types of problems they are familiar with and can provide solutions for. These bots use a flowchart-like structure to map out conversations, anticipating user queries and providing appropriate responses based on the defined rules. Rule-based chatbots can use simple or complex rules but are limited to answering questions within their pre-defined ruleset. They do not learn through interactions, and their performance is limited to the situations they have been trained for. While rule-based bots may have a less flexible conversational flow, they provide the advantage of delivering a predictable experience, unlike AI-based chatbots. One of the major advantages of a rule-based chatbot is its faster training time, making it less expensive than other chatbot alternatives. They are also efficient at detecting and removing weeds, meaning irrelevant or out-of-scope inquiries are quickly identified and dealt with. Moreover, they integrate seamlessly with legacy systems, making them ideal for organizations that already have established systems in place. Rule-based chatbots are highly accountable and secure, providing an added layer of protection

for sensitive information. They can also incorporate interactive elements and media to enhance the user experience. It is important to note that while rule-based chatbots offer several benefits, their effectiveness is limited to the scope of the defined rules. As such, they require constant maintenance and updating to ensure they remain relevant and effective in addressing user queries. Additionally, they may not be suitable for handling complex queries that require a more dynamic approach. In conclusion, rule-based chatbots provide an efficient and cost-effective means of addressing routine user queries. Their predictability and accountability make them ideal for organizations seeking a secure and reliable conversational interface. However, they require ongoing maintenance to remain effective and may not be suitable for more complex inquiries.

1.2.2.2 AI Based Chatbot

In contrast to rule-based chatbots, AI-based chatbots are powered by artificial intelligence and can comprehend the context and intent of a user's inquiry before generating a response. These chatbots use natural language processing to create their own solutions to complex questions and continuously improve their performance as they learn from the data they collect. AI chatbots are often considered as a more sophisticated version of chatbots and are particularly useful for businesses that deal with large volumes of data. Although they require more time and effort to train initially, they can save a significant amount of time in the long run, making them a worthwhile investment for businesses. One of the key advantages of AI chatbots is their ability to learn from data. As they interact with users, they collect and analyze data to understand user behavior and patterns. This information is then used to continuously improve their performance and make more informed decisions. AI chatbots also have a broader range of decision-making skills compared to rule-based chatbots. They can understand more complex questions and generate more personalized responses based on the user's specific needs. Additionally, AI chatbots can communicate in multiple languages, making them suitable for businesses with a global presence. Overall, AI-based chatbots are an excellent choice for businesses that require a more sophisticated and intelligent chatbot solution. While they may require more resources to develop and train, they offer significant advantages in terms of efficiency, performance, and scalability. The introduction of chatbots revolutionized the way we interact with technology. Initially created to mimic human conversation, chatbots have now evolved to serve various purposes. With the ad-

vancement in chatbot technology, it is now possible to use chatbots for information retrieval, decision-making, shopping assistance, and even as language partners. However, chatbots also have their limitations. One of the most common uses of chatbots is as an information retrieval tool. Chatbots can provide users with relevant information on specific topics, from interactive FAQs to helping users make decisions. For instance, the YPA chat- bot, used by British Telecoms Yellow Pages, can search its knowledge base to retrieve the address of a plumber with an emergency service. Similarly, chatbots like ALEX can help law students find essential legal information. Another popular use of chatbots is as a language partner. Chatbots can help lan- guage learners practice their skills at any time, and they can incorporate both text and speech to improve reading, writing, and listening abilities. However, chat- bots responses may be predictable, repetitive, or lacking memory of previous responses, which limits their usefulness for advanced learners. In the field of education, chatbots can act as an amplifier of teaching methods, but not a replacement. Teachers can use chatbots to address student questions and generate log files of the conversations to identify students strengths and weaknesses. However, few chatbots are currently in use in education, which may be due to the limited documentation of their capabilities. It is worth noting that there are two types of chatbots: rule-based chatbots and AI-based chatbots [5]. Rule-based chatbots follow a pre-programmed set of rules, while AI-based chatbots use machine learning to understand the context and intent of a question before generating a response [6]. AI-based chatbots learn from the data they receive, continuously improve their decision-making skills, understand patterns of behavior, and can understand multiple languages. Overall, chatbots have come a long way since their inception and have various applications in different fields. Rule-based chatbots are best suited for simple tasks, while AI-based chatbots are ideal for complex tasks that require understanding the context and intent of a question. Although chatbots have their limitations, they can serve as an amplifier of teaching methods and language learning tools.

1.3 Application of Project

The proposed university enquiry chatbot model has numerous applications and advantages, which are outlined below:

- **Accurate Information:** With the help of the university enquiry chatbot,

students can obtain accurate information in a timely manner. The chatbot's ability to process natural language allows for easy communication with students, and it can quickly provide them with the right source of information.

- **Instant Response:** The university enquiry chatbot, like any other chatbot, provides an instant response to student queries. This means that students do not have to wait long periods for a response, which can help them save time and increase their productivity. The chatbot's ability to respond 24/7 is also a significant advantage, as it can be available to students outside of regular office hours.
- **AI-based Chatbot System:** The proposed chatbot model uses AI-based techniques to process natural language and provide responses to student queries. This makes it highly efficient and effective in handling large volumes of enquiries from students. The AI-based chatbot system can be used by universities and businesses alike to streamline their enquiry processes and reduce workload.
- **Reduced Workload:** The university enquiry chatbot can significantly reduce the workload of universities by automating routine enquiries. This means that universities do not need to hire additional staff to handle the volume of enquiries from students. Instead, the chatbot can take care of routine enquiries, allowing staff to focus on more complex issues.

In addition to the above, the university enquiry chatbot can also improve the overall student experience. With the chatbot's ability to provide accurate and instant responses [7], students are more likely to be satisfied with the level of service they receive. The chatbot can also reduce the number of errors in responses and provide consistent information to all students.

Overall, the proposed university enquiry chatbot model has several applications and advantages that can be leveraged by universities and businesses to improve their enquiry processes, reduce workload, and provide better service to their customers. As the use of chatbots continues to increase, it is likely that they will become an essential part of many organizations' operations.

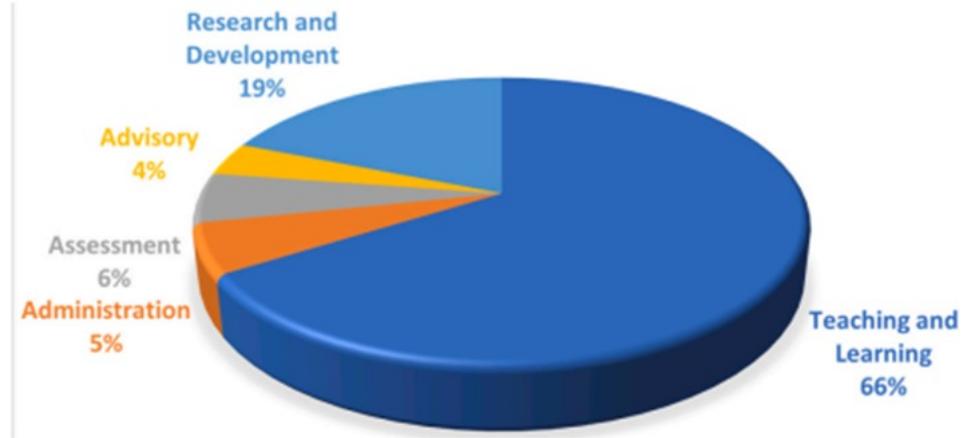

Figure 1.1: Uses of Chatbot in Education

1.4 Problem Statement

Artificial intelligence chatbot is an innovation that makes cooperations among man and machines utilizing normal language handling. We are building a chatbot for the school which answers the client questions with respect to the data about the school. The bot is coordinated to the Slack site. The bot answers to the client with fitting responses inside a negligible portion of second. It likewise contains investigation part which shows the quantity of clients who visited the site and used to bot to get the data about the University. This examination part should be visible simply by the administrator. People frequently get exhausted addressing a similar inquiry over and over and more over human can deal with all things considered 2-3 clients however by executing this bot, it can deal with n number of clients and it is accessible all opportunity in a day.

Chapter 2

LITERATURE REVIEW

2.1 Old Researches

A literature survey is an essential part of any research, providing a comprehensive overview of previous studies on a particular topic. In the field of education, chatbots have been gaining increasing attention due to their potential to enhance learning experiences by providing quick and efficient access to information. This chapter presents a review of the old research studies on chatbots in educational institutions. One such study was conducted by Dr. Vishwanath Karad [8], who proposed a rule-based chatbot algorithm for an educational institution. The chatbot analyzed user queries, matched them with a knowledge base, and provided appropriate responses. While the study demonstrated the feasibility of chatbots in educational settings, it was limited to a rule-based algorithm and did not explore more advanced machine learning approaches. Another study by Harshala Gawade, Vedika Patil, Prachi Vishe, and Sonali Kolpe [9] utilized bigram and tokenization algorithms to build a chatbot for an educational institution. The chatbot analyzed user queries and used the bigram tokenization algorithm to identify key terms and provide relevant responses on a GUI screen. While this study demonstrated the potential of machine learning algorithms in chatbot development, it was limited to a specific set of algorithms and did not investigate the effectiveness of the chatbot in enhancing the learning experience. Mayuri Bhoir, Runa Ahirrao, and Madhuri Rodge [10] proposed a chatbot for an educational institution, which utilized the Chatterbot algorithm. The chatbot analyzed user queries and generated responses on a GUI screen. This study

demonstrated the effectiveness of the Chatterbot algorithm in developing chatbots for educational institutions, but it also had limitations, such as a lack of exploration of other machine learning algorithms. Overall, these previous studies demonstrated the feasibility of chatbots in educational institutions and provided insights into the potential of various algorithms. However, they also had limitations, such as the use of limited algorithms and a lack of investigation into the effectiveness of the chatbots in enhancing the learning experience. Future studies should explore more advanced machine learning algorithms and investigate the impact of chatbots on student learning outcomes.

2.2 Proposed System

The development of chatbots has transformed the way institutions interact with their stakeholders, especially in the education sector. The need for users to physically visit the institution for inquiries, as the chatbot can analyze queries and provide responses in real-time. The RASA Stack algorithm is used to perform calculations on the users queries and match them with the information stored in the database. The chatbot generates an appropriate response that mimics a human's response to the query. The system utilizes a GUI interface that enhances the user experience, as the chatbot responses are presented in a manner that appears as if a real person is answering the inquiry. The University Enquiry Chatbot is designed to guide students and parents through the school enquiry process, providing relevant information with just a click on the chatbot. The proposed system also provides answers to general questions related to the school enquiry process. Users can raise any school-related activities through the chatbot, which responds with accurate information. The University Enquiry Chatbot is developed to enhance the overall experience of users in the institution and provide prompt solutions to their inquiries. Overall, the University Enquiry Chatbot is an innovative solution that simplifies the school enquiry process for administrators, students, and parents. The proposed system utilizes advanced algorithms to generate appropriate responses to user queries, thereby enhancing the efficiency and effectiveness of the enquiry process. The GUI interface and natural language processing techniques employed by the chatbot provide a seamless experience for users, making the system user-friendly and easily accessible. Chapter 3

METHODOLOGY

The proposed system incorporates a combination of qualitative and quantitative research methodologies, which includes literature reviews, expert opinions, focus groups, and content validation. The system architecture includes an online enquiry module where students can enquire about various aspects related to their academic performance, examination schedules, fee structures, and placement opportunities. Given underneath is the framework design of this talk bot:

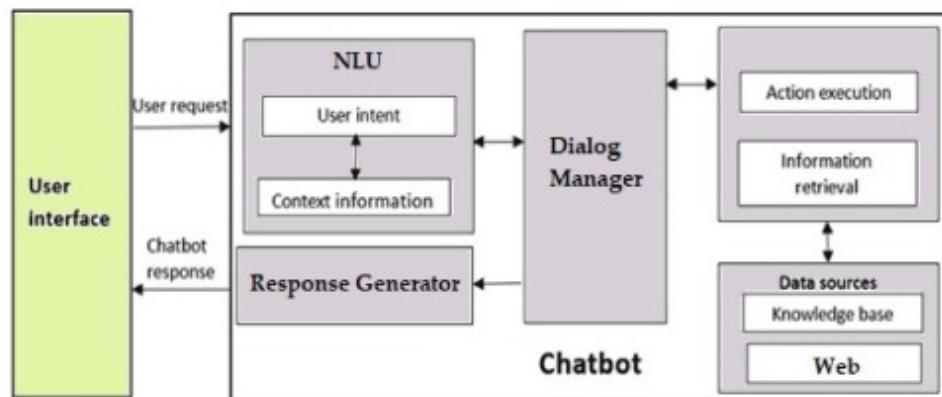

Figure 3.1: Methodology

The basic algorithm that will be implemented for the working of this proposed system is as follows:

1. **Step 1:** Start.
2. **Step 2:** Get the input query from the user.

3. **Step 3:** The query is pre-processed, extracting features such as intents and entities.
4. **Step 4:** Create a response using a dialogue manager.
5. **Step 5:** Match the fetched keywords with the keywords in the Knowledge base and perform the RASA Stack algorithm on it.
6. **Step 6:** Return the query response to the bot.
7. **Step 7:** Package the data into a proper response for display by the client.
8. **Step 8:** Exit.

Once the algorithm is performed, the chatbot returns the query response to the user. The chatbot then packages the data into a proper response for display by the client [11]. Finally, the system exits. This methodology ensures that the proposed chatbot system provides an effective and efficient solution to university enquiries, by enabling students to receive accurate and timely responses to their queries, without the need for physical presence or long waiting periods.

To further validate the proposed system's effectiveness, the research team will conduct a focus group study with a group of university students. This study will involve asking students to provide feedback on the chatbot's functionality, usability, and responsiveness. The data obtained from this study will be analyzed and used to refine the system, ensuring that it meets the requirements and needs of the target users. Overall, the proposed methodology is a robust and systematic approach to developing and evaluating the effectiveness of the university enquiry chatbot system.

3.1 Dataset Collection

In this section, we present the details of the dataset collection process for the development of a RASA Chatbot for university admission purposes. Our dataset comprises 74 unique scenarios, each containing 10 to 15 questionnaires. To ensure a comprehensive and diverse dataset, we employed a variety of sources, including:

- Internet research,
- Interviews with 12th-grade students,

- Social media groups such as WhatsApp and Facebook, and
- Personal networks.

We also leveraged Google Forms and interacted directly with students to obtain a rich and varied dataset. The dataset collection process involved multiple steps to ensure its accuracy and reliability. We initiated the process by conducting research on frequently asked questions related to university admissions, including admission criteria, academic requirements, and financial aid options. We then developed a structured questionnaire with different questions for different departments and associated support teams. We distributed these questionnaires to front desk staff, who assisted students in filling them out. We also gathered data from physical forms filled out at the university's help desk, as well as through discussions and website visits. To ensure data consistency, we cross-checked the responses from different sources and eliminated duplicate entries. Additionally, we collected data from different departments, including the admissions office, academic departments, financial aid office, and student services. The collected dataset was then processed and cleaned to eliminate any outliers or incorrect responses. We employed various data cleaning techniques, including data transformation, removal of missing values, and outlier detection. In conclusion, the dataset collection process for the RASA Chatbot for university admission purposes involved multiple sources, methods, and techniques to ensure its accuracy, reliability, and comprehensiveness. The resulting dataset is a rich and diverse collection of questions and answers related to university admissions, which will serve as a valuable resource for the development of the chatbot. In this section, we present the details of the dataset collection process for the development of a RASA Chatbot for university admission purposes. Our dataset comprises 74 unique scenarios, each containing 10 to 15 questionnaires. To ensure a comprehensive and diverse dataset, we employed a variety of sources, including internet research, interviews with 12th-grade students, social media groups such as WhatsApp and Facebook, and personal networks. Figure 3.2: Dataset Collection

3.1.1 Examples

RASA is an open-source framework for building chatbots and virtual assistants [12]. It uses natural language processing (NLP) and machine learning (ML) to understand user input and provide relevant responses [13]. RASA chatbots can be integrated with various messaging platforms, including Facebook Messenger, WhatsApp, and Slack, making it an ideal solution for businesses and organizations that want to provide automated customer support or handle repetitive tasks. In the context of university admissions, a RASA chatbot can be used to answer student queries about admission procedures, program requirements, fee structures, and other relevant information. Now, let's take a closer look at some of the scenarios you collected in your dataset and how they can be handled by a RASA chatbot:

1. **Admission Schedule:** A RASA chatbot can be programmed to provide students with the latest information about admission schedules, deadlines, and important dates. It can also answer questions about the admission process and provide guidance on how to submit an application.
2. **Fee Structure:** A RASA chatbot can help students understand the different types of fees they need to pay, such as tuition fees, application fees, and other charges. It can also provide information about payment methods, deadlines, and any financial aid or scholarship programs that may be available.
3. **Offered Programs:** A RASA chatbot can assist students in selecting a program by providing information about the various programs offered by the university, including their requirements, curriculum, and duration. It can also answer questions related to program options, such as specializations or joint programs.
4. **Scholarship:** A RASA chatbot can help students understand the scholarship programs offered by the university and provide guidance on how to apply. It can also provide information about eligibility criteria, deadlines, and the application process.
5. **Credit Hour:** A RASA chatbot can provide students with information about credit hours required for different programs and courses. It can also provide guidance on how to calculate credit hours and how they affect a student's academic progress.
6. **Hostel:** A RASA chatbot can provide information about hostel facilities and the application process. It can also answer questions related to hostel rules, fees, and other relevant information.
7. **Entry Test Pattern:** A RASA chatbot can help students understand the entry test pattern for different programs and provide guidance on how to prepare for the test.
8. **Evening Classes:** A RASA chatbot can provide information about evening classes offered by the university and answer questions related to their availability, program options, and other relevant information.
9. **Transfer:** A RASA chatbot can assist students in the transfer process by providing guidance on the requirements, documentation, and deadlines.

It can also answer questions related to eligibility, program options, and other relevant information.

10. **Events:** A RASA chatbot can provide information about university events, such as career fairs, seminars, and workshops. It can also assist students in registering for events and provide relevant information, such as the schedule and location.
11. **Aggregate:** A RASA chatbot can provide students with information about how the aggregate is calculated and how it affects their eligibility for different programs.
12. **Class Duration:** A RASA chatbot can provide information about class duration, such as the length of lectures and the number of classes per week.
13. **Summer Semester:** A RASA chatbot can provide information about summer semester programs offered by the university, including their duration, requirements, and eligibility criteria.
14. **Freezing Semester:** A RASA chatbot can help students understand the freezing semester process and provide guidance on how to apply for freezing a semester, including the required documentation, deadlines, and other relevant information.
15. **Campuses:** A RASA chatbot can provide information about different university campuses, including their location, facilities, and programs offered.
16. **Paper Rechecking:** A RASA chatbot can provide guidance on the paper rechecking process, including the requirements, fees, and deadlines. It can also answer questions related to eligibility and the outcome of the rechecking process.
17. **Mosque:** A RASA chatbot can provide information about the mosque facilities available on campus, including their location, prayer times, and other relevant information.
18. **Auditorium:** A RASA chatbot can provide information about auditorium facilities available on campus, including their location, capacity, and availability for events.

19. **Contacts:** A RASA chatbot can provide contact information for various university departments, including admissions, academics, student affairs, and other relevant departments.
20. **Address:** A RASA chatbot can provide the university's address and location, as well as directions on how to get there.

Overall, a RASA chatbot can be a valuable tool for universities to provide students with quick and easy access to information related to admission procedures, program requirements, fee structures, and other relevant information. By leveraging natural language processing and machine learning, a RASA chatbot can provide personalized responses and assistance to students, helping them make informed decisions about their education and reducing the workload of university staff.

Figure 3.3: Examples of Dataset Scenarios

3.2 Design Procedure

The process of designing a chatbot begins with understanding its fundamental components. First and foremost, the term "bot" refers to a computer program that performs automated tasks or executes specific commands based on

input data. In the context of chatbots, the program is designed to detect specific message patterns, either in the form of text or voice messages, submitted by users [14], and respond with pre-defined actions. Chatbots are capable of communicating through various channels, such as Face- book Messenger, Siri, WeChat, Telegram, SMS, Slack, Skype, and many others. Moreover, advancements in natural language processing and speech recognition technologies have enabled chatbots to respond to user inquiries with automated actions and voice messages, as demonstrated by Amazon Alexa, Google Home, and Microsoft Windows Cortana. It is worth noting that messaging apps have surpassed online entertainment platforms in terms of user engagement. This trend has led to an increased adoption of chatbot experiences by businesses and organizations, who use messaging apps as a primary channel for communicating with their customers. Therefore, designing a chatbot requires a deep understanding of the users needs and preferences, as well as the platform on which the chatbot will be deployed. The chatbots functionality and capabilities must align with the users requirements, while also considering the limitations of the messaging platform. Additionally, the chatbots responses must be contextually appropriate, accurately reflecting the users intent and providing relevant information or services. Overall, the design of a chatbot requires a strategic approach that considers the fundamental components of the bot, the users needs and preferences, and the messaging platform on which the bot will be deployed. By aligning these elements, a well-designed chatbot can provide an effective and efficient means of communication and service delivery for both businesses and users.

3.3 Chatbot Frameworks

Numerous business substances are attempting to make their own bots on the lookout, however when they decide to foster a bot, then they got befuddled between the stages for chatbot advancement. There are a lot of chatbot stages are accessible from which we can make chatbot, however it is challenging for specialty unit to choose. Beneath referenced are not many systems which are being utilized to make chatbot:

1. IBM Watson Conversation
2. Microsoft Bot Framework
3. Dialogflow

4. Amazon Lex

5. ManyChat

6. **RASA Stack**

We choose the **RASA Stack** system. asa stack contains a square of open source AI devices solely utilized in mean to make a relevant chatbots and collaborators. The administrations hold by this stage goes through a significant characterization of strong APIs and inserted along with Rasa stack which incorporates Rasa center and Rasa NLU as an occasion stream talked about all through this paper and furthermore the calculation engaged with expanding upon this stage. Its fixings incorporate the Bag of words calculation helping in working on portrayal utilized in the NLP, CRFs - Conditional Random Field utilized in measurable displaying and AI stages and furthermore trend setting innovation like LTSM brain organizations. It additionally supports the utilization of this RASA stage for the client required custom arrangement according to their necessities and furthermore elevates to contribute in fostering the stage for improved proficiency of the stage to work

3.4 Design Details

The RASA stack is one of the most broadly acclaimed open source visit bot building systems. The RASA NLU handles purpose acknowledgment and element revelation, though the RASA center handles setting and discourse the executives. Rasa NLU inside utilizes Bag of word calculation to track down goal and Conditional Random Field (CRF) to track down substances. The RASA center uses keras structure to execute a LTSM brain network for exchange the executives. This report targets giving an outline into the previously mentioned strategies which are utilized in RASA in the engine. This study was improved comprehend the understudy aide chatbot that we had worked to serve the University necessities.

3.4.1 RASA NLU Model

n this section, we will delve into the Rasa NLU model and its various components that aid in distinguishing goals and entities. The pipeline employed by Rasa involves parsing the text until it extracts the relevant entities and goals. The

process begins with text input, which is then processed through several stages to generate the desired output.

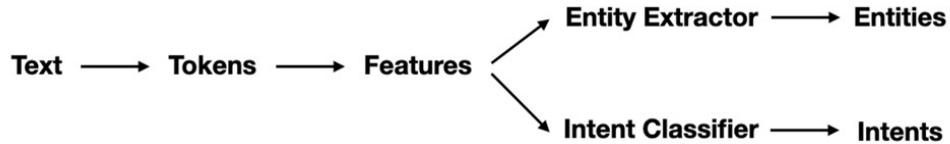

Figure 3.4: RASA NLU Model

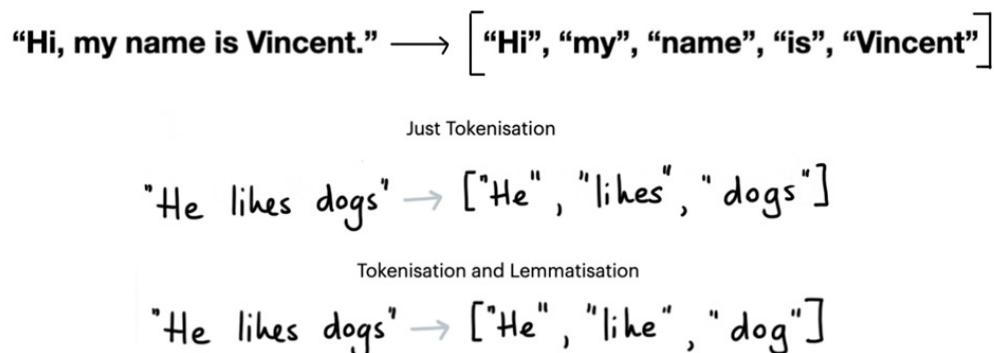

The Rasa pipeline includes various components, such as

1. Tokenizers
2. Featurizers
3. Intent Classifiers
4. Entity Extractors

that play a crucial role in the pipelines functioning. Let us discuss each of these components in detail

3.4.1.1 Tokenizers

The first step in the Rasa pipeline is to tokenize the input text into smaller pieces, known as tokens. This process occurs before the text is featurized for AI models, which is why the tokenizer is usually the first component in the pipeline.

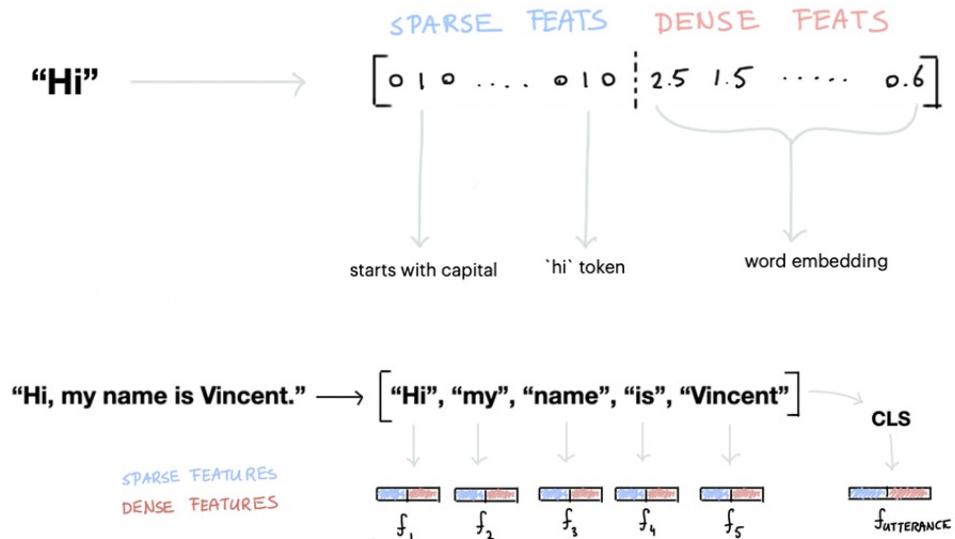

Tokenizers not only divide the text into tokens but also add additional information to each token. For example, spaCy can generate lemmas of the tokens that can be used by the CountVectorizer. The tokenizer splits each word in the text

into a separate token, resulting in a list of words. Tokens for punctuation marks may also be generated, depending on the tokenizer and the settings. For English, the preferred tokenizer is the WhiteSpaceTokenizer, while for non-English languages, other tokenizers such as spaCy and Jieba are commonly used. It is worth noting that tokenizers do not modify the underlying text; they only split the text into tokens. This means that capitalization remains intact, and lower-cased text encoding is the responsibility of the featurizer.

3.4.1.2 Featurizers

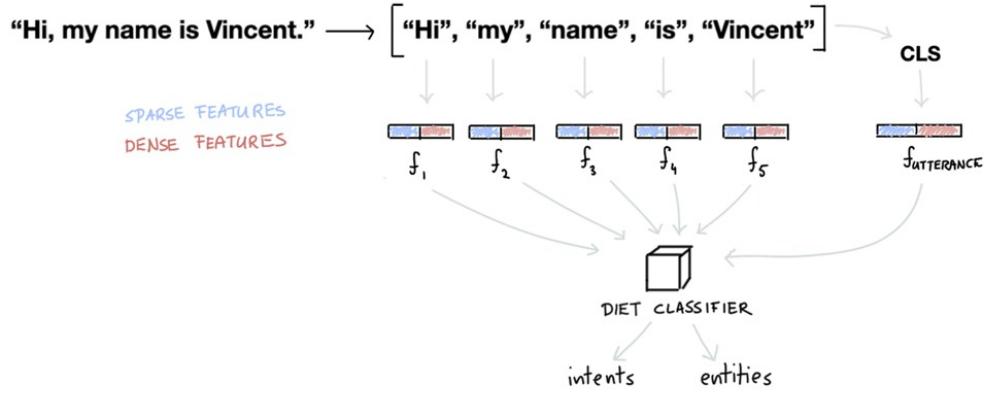

Featurizers create numeric highlights for AI models. The outline underneath shows how "Hey" may be encoded.

Featurizers are responsible for generating numeric features for AI models. They create features for tokens and the entire sentence, including the CLS token. The CLS token is a representation of the entire sentence, and its sparse features are a sum of all the sparse features of the tokens. The dense features, on the other hand, are either a pooled aggregate or mean of word vectors (in the case of spaCy) or a contextualized representation of the entire text (in the case of HuggingFace models). It is important to note that users can add their own components with custom featurization tools. For example, the rasa-nlu-models project maintained by the community contains several experimental featurizers for non-English languages. While it is not officially supported by Rasa, it can be beneficial to many users, given the numerous languages supported by the tool.

3.4.1.3 Intent Classifiers

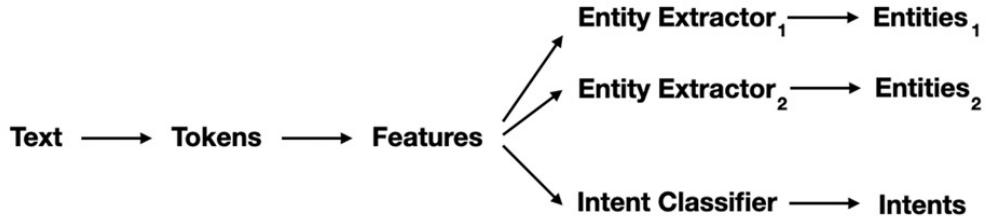

After generating features for tokens and the entire sentence, the next step in the pipeline is to pass the features to an intent classification model. We recommend using Rasa's DIET model, which can handle both intent classification and entity extraction [15]. It can also learn from both token and sentence features.

The DIET algorithm is unique in that it can perform both entity detection and intent classification, unlike most algorithms that Rasa previously hosted, which could only perform one of the two tasks. Furthermore, intent classification models in the past only considered the sentence features of the pipeline and ignored the token features. In conclusion, the Rasa pipeline involves several stages, including tokenization, featurization, and intent classification. Each of these components plays a critical role in the pipeline's functioning and contributes to the successful extraction of entities and goals. By understanding the various components of the Rasa pipeline, developers can build more efficient and effective chatbots and virtual assistants.

3.4.1.4 Entity Extraction

Despite the fact that DIET is fit for figuring out how to recognize substances, we don't be guaranteed to suggest involving it for each kind of element out there. For instance, substances that follow an organized example, similar to telephone numbers, don't actually require a calculation to distinguish them. You can simply deal with it with a RegexEntityExtractor all things considered. Therefore having more than one sort of substance extractor in the pipeline is normal.

Now that we've given an outline of the various sorts of parts in the NLU pipeline we can continue on to make sense of how these parts share data for one another. A characteristic language understanding arrangement which takes the client information and attempts to surmise the expectation and concentrate the accessible elements. The RASA NLU handles plan acknowledgment and substance disclosure. Rasa NLU inside utilizes Bag of word calculation to track down expectation and Conditional Random Field (CRF) to track down substances.

3.4.1.5 Steps for identifying features by RASA NLU

Input: First we take input.

Tokenization: Tokenize the input text.

Featurization: Make matrix using:

- Sparse Featurizer
- Densed Featurizer

Transformation Layer: Extract intents and entities using Featurized Matrix.

3.4.1.6 Example:

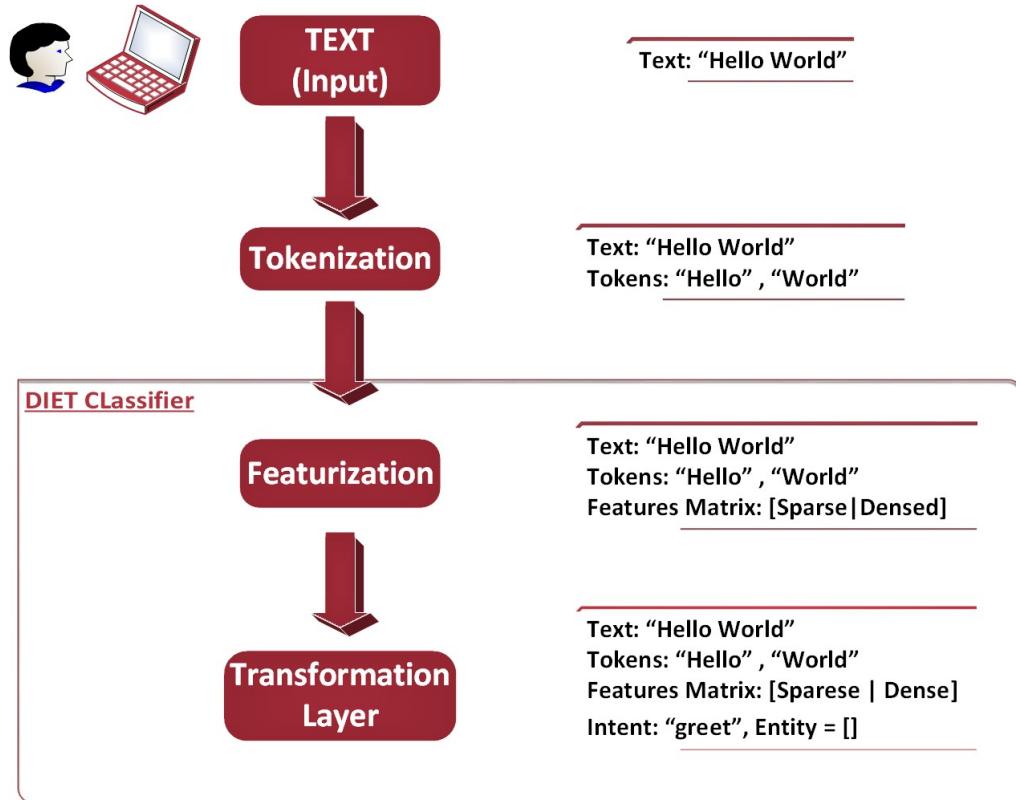

Figure 3.5: Internal Structure of RASA NLU

3.4.2 RASA Core

Rasa Core plays a crucial role in the Rasa framework as it handles the management of conversations between a chatbot and a user. One of its primary responsibilities is to track the context of the ongoing conversation and select the next appropriate action based on the current state of the conversation. This is accomplished by predicting the next probable "state" or goal of the chatbot conversation based on the submitted message. At runtime, Rasa Core relies on its specialized feature called "stories," which are sequences of potential goals submitted by engineers during the training stage. To execute conversation management, Rasa Core employs the Keras framework to implement a Long Short-Term Memory (LSTM) neural network. LSTM is a type of Recurrent Neural Network (RNN) [16], which has recurrent connections between its units or neurons. Unlike traditional neural networks, RNNs can process sequential data by maintaining information in their hidden state. This enables RNNs to analyze and

learn from input data that has temporal dependencies. An LSTM unit is a type of RNN unit that is specifically designed to learn long-term dependencies [17]. It has a unique architecture that allows it to store and access information for long periods, even when new data is introduced. LSTM units contain a memory cell, which is used to store the long-term memory of the network, and three gates that regulate the flow of information into and out of the memory cell [18]. These gates include the input gate, output gate, and forget gate, which are used to control the flow of information through the cell. When training the Rasa Core LSTM neural network, engineers submit "stories," which are sequences of potential goals or outcomes of a conversation. These stories are used to train the network to predict the next probable state or goal of the chatbot conversation based on the submitted message. The Rasa Core LSTM neural network processes the input message through a series of LSTM units or layers, each of which receives input from the previous layer and passes output to the next layer. One of the benefits of using an LSTM neural network for conversation management is that it can handle both short-term and long-term dependencies in the conversation. This is important because chatbot conversations often involve complex interactions between multiple topics and concepts, which can be difficult to track without a neural network. The use of an LSTM neural network allows Rasa Core to provide more personalized and relevant responses to users, based on their previous interactions with the chatbot. In conclusion, Rasa Core is an essential component of the Rasa framework that is responsible for managing conversations between a chatbot and a user. It uses a specialized LSTM neural network to predict the next probable state or goal of the chatbot conversation based on the submitted message. This allows it to provide more personalized and relevant responses to users, making it a valuable tool for chatbot developers.

3.4.2.1 LSTMs are RNNs

Long Short-Term Memory (LSTM) is a type of Recurrent Neural Network (RNN) that contains cyclic associations. It is a refined version of a standard RNN unit and is composed of gates that control the flow of information through the unit. The fundamental distinction between an LSTM unit and a standard RNN unit is the presence of gates in the former that regulate the input into the unit, the output from the unit, and what the cell should forget. The LSTM architecture comprises input gates, forget gates, and output gates that are signified by $i(t)$, f_t ,

and O_t , respectively. In addition, the architecture includes a cell, which is the primary component that a neuron of a vanilla RNN contains. The LSTM unit is more refined because of the presence of these gates, which help in better controlling the flow of information through the unit. The input gate, for instance, regulates the information that enters the unit, whereas the forget gate regulates what information the cell should forget. The output gate regulates the information that exits the unit.

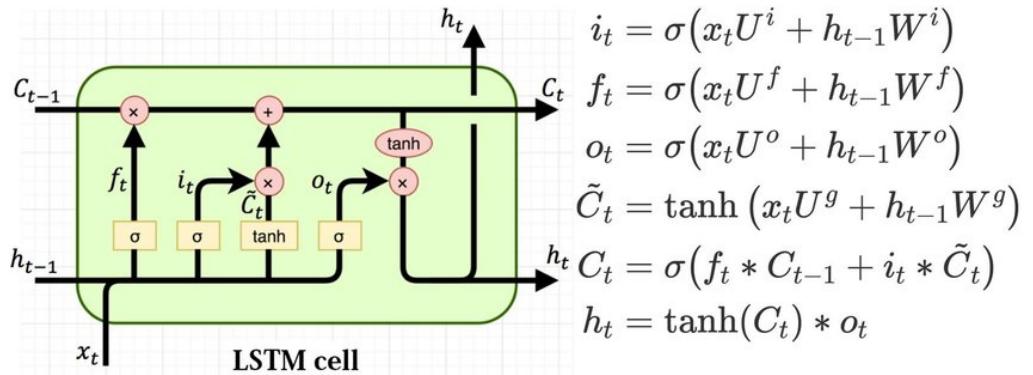

Figure 3.6: LSTM Architecture

The LSTM architecture also contains cyclic associations, which allow it to process sequential information. The cyclic associations enable it to maintain information from previous time-steps and incorporate it into the current processing step. Any recurrent brain organization, including an LSTM, can be represented as a graph that contains one or more cyclic associations. The cyclic connections are critical to the LSTMs ability to handle sequential data effectively. The LSTM architecture is highly versatile and has several applications in natural language processing, speech recognition, and other fields. To gain a deeper understanding of the architecture, one can refer to the original paper that proposed the LSTM by S. Hochreiter and J. Schmidhuber. Alternatively, there are numerous accessible resources online that provide an overview of the LSTM architecture and its components. In conclusion, the LSTM architecture is a type of RNN that contains cyclic associations and gates that regulate the flow of information through the unit. The architectures ability to handle sequential data and maintain information from previous time-steps makes it highly versatile and applicable to various fields. The LSTM architecture is a powerful tool for processing sequential data and has contributed significantly to advancements in natural language processing and speech recognition.

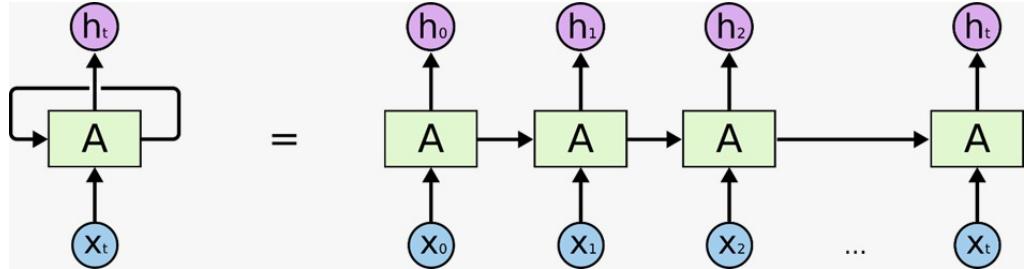

Figure 3.7: RNN Architecture

3.4.2.2 Example

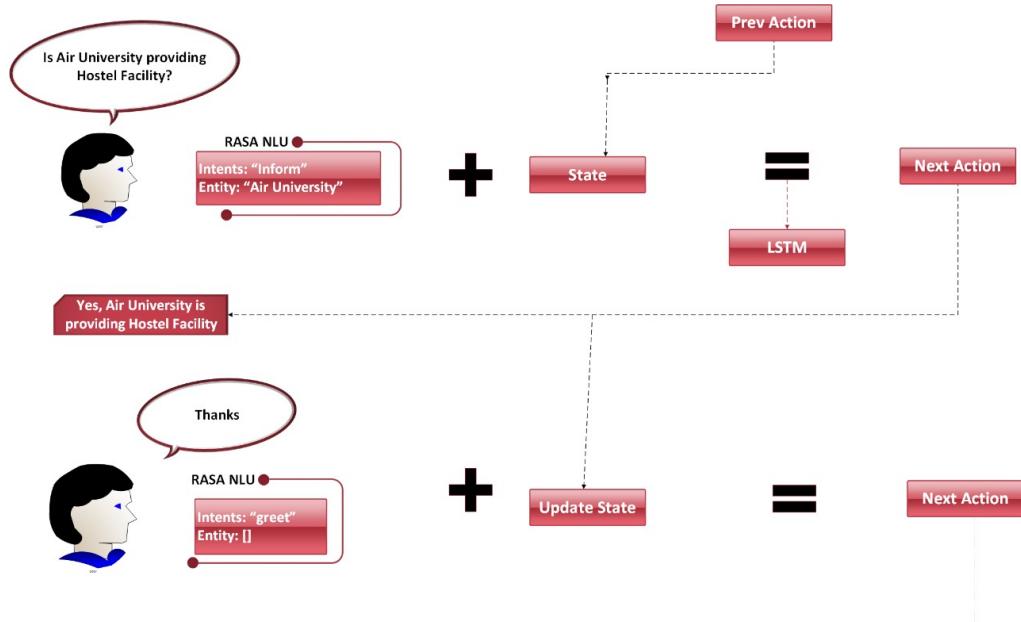

Figure 3.8: RASA NLU and RASA CORE Example

3.5 Integrating Chatbot with Slack and Facebook Page using Ngrok

To enable the chatbot to interact with users through Slack and Facebook Page, it is necessary to integrate the chatbot with these platforms. The integration process involves creating a bot account on each platform and configuring it to receive and respond to messages. In addition, a tool called Ngrok can be used to expose the chatbot running locally to the internet, allowing the chatbot to receive messages from Slack and Facebook. Ngrok is a lightweight tool that creates a secure tunnel between a local machine and the internet. By using Ngrok, the

chatbot can receive messages from Slack and Facebook even if it is running on a local machine. To use Ngrok, the chatbot needs to be running on the local machine and Ngrok needs to be installed and configured. Once Ngrok is installed and configured, the next step is to create a bot account on Slack and Facebook. For Slack, a bot account can be created through the Slack API website. For Facebook, a bot account can be created through the Facebook Developers website. Once the bot account is created, the bot token needs to be obtained and configured in the chatbot code. To enable the chatbot to receive messages from Slack and Facebook, the bot needs to be subscribed to the appropriate events. In Slack, this involves subscribing to the message event. In Facebook, this involves subscribing to the messages webhook. Once subscribed, the chatbot can receive messages from users and respond appropriately. In conclusion, integrating the chatbot with Slack and Facebook using ngrok enables the chatbot to interact with users through multiple channels. This enhances the user experience and increases the reach of the chatbot. By using Ngrok, the chatbot can be developed and tested locally before deploying it to a server, reducing development time and increasing productivity.

Figure 3.9: Connecting chatbot to Facebook and Slack using ngrok

3.6 Road Map of Project

Here is the road map of our whole project:

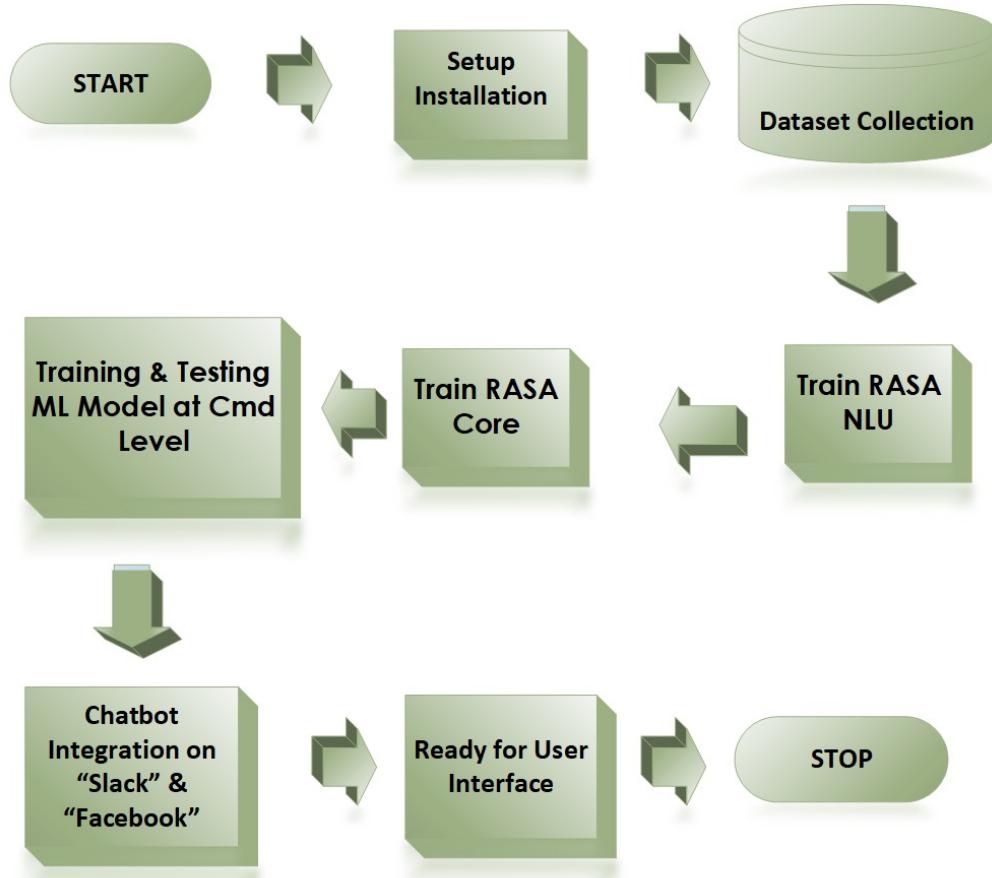

Figure 3.10: Block Diagram

Chapter 4

Results and Discussion

4.1 Results and Discussion

In this section, we present the results and discussion of our chatbot system. To illustrate how our model works, we provide an example scenario in which a user sends a message to the chatbot asking about the availability of hostel facilities at Air University. The message is first processed by the RASA NLU section, where intent and entities are extracted. These features are then passed to the RASA Core section, where a response is generated using features and RNN, and displayed on the screen.

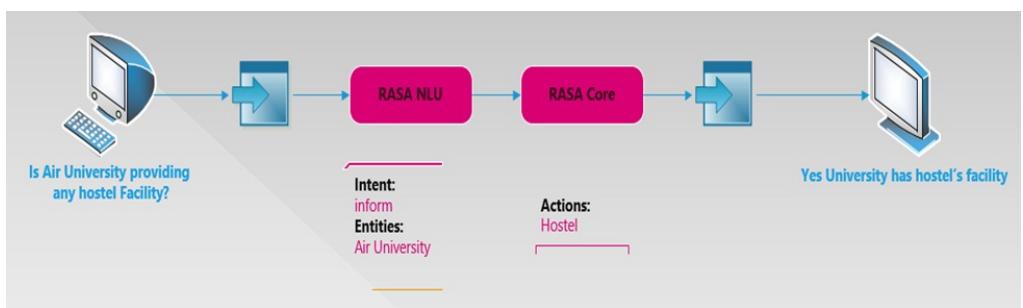

Figure 4.1: RASA Top View

To expound on the dialogue policy or dialogue management, our approach involves creating training data from stories and utilizing this data to train a model [19]. Stories refer to scenarios or schemes within a specific topic in any chat flow that we design or expect [20]. By creating training data from these stories, we are able to train our chatbot system to generate appropriate responses during a conversation. The dialogue policy is responsible for deciding which action to take

at each stage of the conversation. Different policies can be used and multiple policies can be included in a single agent or chatbot. The policy that predicts the next action with the highest confidence is used at each turn in the conversation. Our chatbot system employs two policies, namely the memoization policy and the neural network policy. The execution of the policy is based on priority, where the policy with the highest confidence score is executed first. The memoization policy records previous conversations in the training data and predicts the next action with a confidence score of 1.0 if the exact conversation exists in the training data. Otherwise, it predicts None with a confidence score of 0.0. The neural network policy is implemented in Keras and selects the next action using a default architecture based on an LSTM. It is configured with a masking layer (input, 5, 32), LSTM units (32), dropout=0.2, and a dense layer (19) with 100 training epochs.

Regarding user interaction with the chatbot at the command-line level, this is a crucial aspect of the overall chatbot system. Users can interact with the chatbot by inputting text commands, which are then processed by the bot to provide relevant responses. This interaction is facilitated by the chatbot's natural language processing (NLP) capabilities, which enable it to understand user queries and generate appropriate responses. Users can provide feedback by rating the chatbot's responses, providing comments or suggestions, or reporting any errors or issues they encounter.

At the command prompt level, user interaction with the chatbot is facilitated by the chatbot's natural language processing (NLP) capabilities. Users can input text queries in natural language, and the chatbot utilizes algorithms and machine learning techniques to process these queries and provide relevant responses.

Providing feedback is an important aspect of user interaction with the chatbot. Feedback enables the chatbot to learn and improve its responses over time, leading to more accurate and useful responses in the future. Users can provide feedback by rating the chatbot's responses, providing comments or suggestions, or reporting any errors or issues they encounter.

In terms of the user interaction with the chatbot at the command-line level, the user can input text commands, which the bot then processes to provide relevant responses. This interaction is critical to the overall chatbot system's success [21]. The chatbot's ability to understand user queries and provide appropriate responses is essential to its effectiveness in addressing user needs.

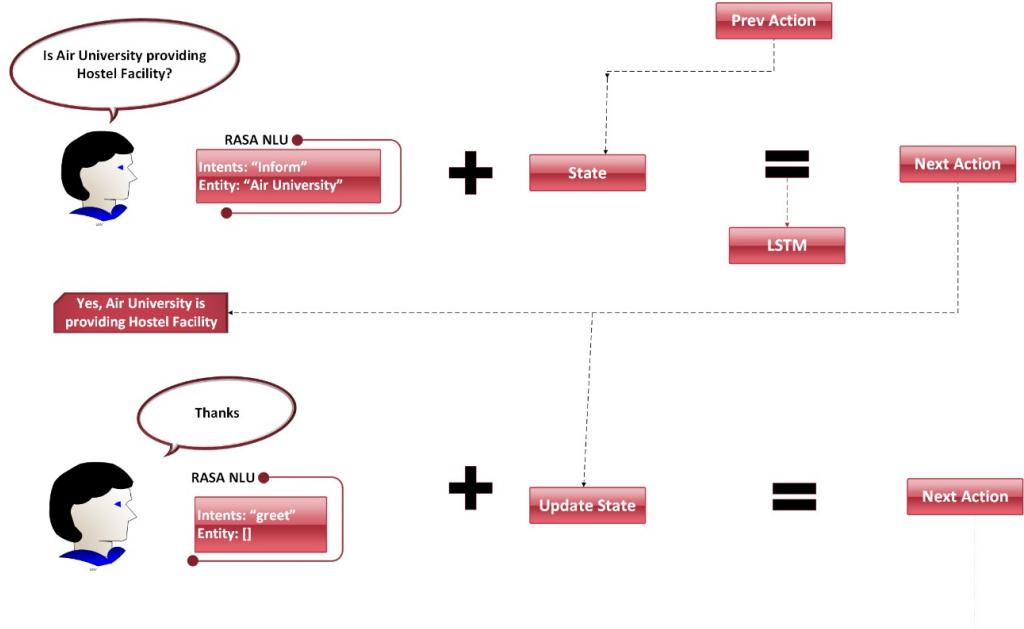

Figure 4.2: RASA NLU and RASA CORE Example

4.2 Interaction of Chatbot with User

4.2.1 Testing at Command Prompt Level

The user interaction with the chatbot at the command-line level is a crucial aspect of the overall chatbot system. At the command-line interface, users can easily interact with the chatbot by inputting text commands, which the bot then processes to provide relevant responses.

This interaction is facilitated by the chatbot's natural language processing (NLP) capabilities, which enable it to understand user queries and provide appropriate responses. Users can input text queries in natural language, and the chatbot utilizes algorithms and machine learning techniques to process these queries and provide relevant responses.

One important aspect of user interaction with the chatbot is the ability to provide feedback. Feedback enables the chatbot to learn and improve its responses over time, leading to more accurate and useful responses in the future. Users can provide feedback by rating the chatbot's responses, providing comments or suggestions, or reporting any errors or issues they encounter. User interaction with chatbot at cmd level is given by,

Figure 4.3: Interaction of Chatbot with User

4.2.2 Interaction on Slack

It is important to understand the user interaction with chatbots, and Slack is one of the platforms where chatbots are commonly used. When a user interacts with a chatbot on Slack, they can communicate through text messages, voice commands, or even interactive buttons.

Text messages are the most common way of interacting with a chatbot on Slack. The user types a message and sends it to the bot, and the bot processes the message using natural language processing (NLP) techniques. The bot then generates a response and sends it back to the user. The user can continue the conversation by typing another message. User interaction with chatbot at Slack is given by,

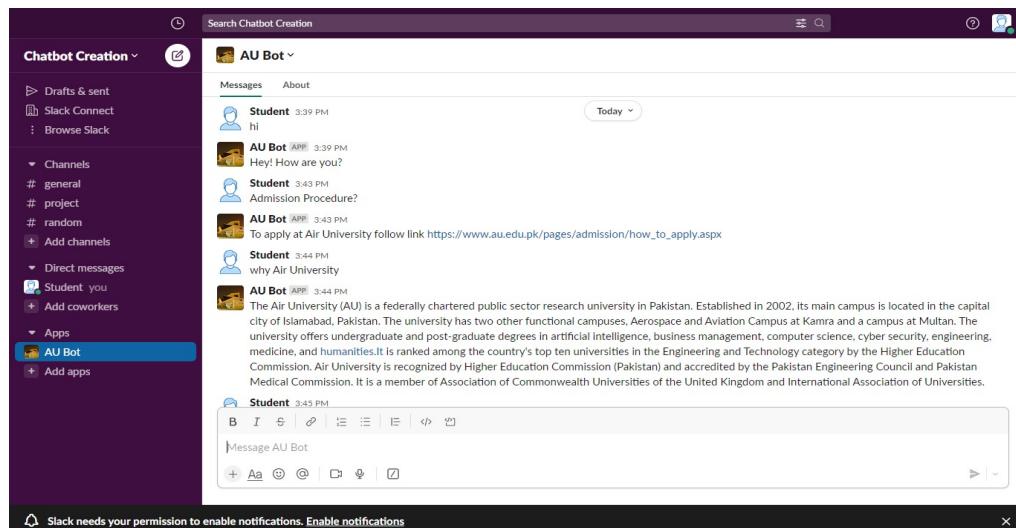

Figure 4.4: Interaction of Chatbot on Slack

4.2.3 Interaction on Facebook Page

The user interaction with the chatbot is a crucial aspect of the system. In the proposed University Enquiry Chatbot, the user interacts with the system through the Facebook page of the university. The chatbot is integrated into the Facebook Messenger platform, which enables users to send messages to the chatbot as if they are communicating with a human.

When a user sends a message to the chatbot, it triggers the chatbot to perform various tasks, such as retrieving information from the database, processing the user's input, and generating an appropriate response. The chatbot utilizes the RASA Stack algorithm to interpret and comprehend the user's message, which is then compared against the system's database to generate an appropriate response. The chatbot is capable of answering general inquiries about the university, such as admission criteria, course details, and other related queries.

The chatbot's ability to communicate with users via Facebook Messenger makes it easily accessible to students, faculty, and staff members. The chatbot's responses are generated quickly and accurately, ensuring that users receive timely and accurate information. The chatbot's integration with Facebook also makes it easy for the university to reach out to a wider audience and increase its online presence.

Overall, the user interaction with the chatbot is a seamless and convenient process that allows users to receive the information they need quickly and efficiently. The chatbot's ability to understand natural language and provide personalized responses makes it a valuable tool for the university's administration to provide quality customer service to its stakeholders.

Figure 4.5: Interaction of Chatbot on Facebook Page

4.3 Accuracy and Precision Evaluation

The accuracy and precision of a chatbot model are crucial metrics to assess its performance and reliability. In the context of your Rasa chatbot, you have obtained valuable insights through the execution of the `rasa test` command. Let's delve into the results to analyze the accuracy and precision achieved by your model. Here is a screenshot of the evaluation results for the actions performed by the Rasa chatbot

```
2023-06-02 12:01:28 INFO  rasa.core.test - Evaluation Results on ACTION level:
2023-06-02 12:01:28 INFO  rasa.core.test -  Correct:      35 / 35
2023-06-02 12:01:28 INFO  rasa.core.test -  F1-Score:     1.000
2023-06-02 12:01:28 INFO  rasa.core.test -  Precision:    1.000
2023-06-02 12:01:28 INFO  rasa.core.test -  Accuracy:     1.000
2023-06-02 12:01:28 INFO  rasa.core.test -  In-data fraction: 0

 [ 0  0  0  0  0  0  1]]
```

Figure 4.6: Evaluation Results on ACTION level

4.3.1 Accuracy

Accuracy is a fundamental evaluation metric that gauges the model's ability to correctly predict the outcome of conversations. It is calculated by dividing the number of accurately predicted conversations by the total number of conversations tested. In your case, the accuracy achieved is an astounding 100%. This indicates that your Rasa chatbot accurately predicted all 7 conversations during the testing phase. Such a high accuracy score underscores the effectiveness of your model in comprehending and responding to user inputs accurately.

4.3.2 Precision

Precision is an essential measure to evaluate the correctness of predicted actions by the model. It assesses the proportion of correctly predicted actions out of all the actions predicted by the model. In your evaluation results, the precision score achieved an impeccable 100%. This signifies that every single action predicted by your chatbot was correct, out of the 35 actions tested. This remarkable

precision score highlights the reliability and precision of your Rasa chatbot in generating appropriate responses and taking the intended actions.

The exceptional accuracy and precision exhibited by your Rasa chatbot indicate the high performance and reliability of the model. With an accuracy of 100%, your chatbot demonstrates a robust understanding of user conversations, enabling it to provide accurate and contextually relevant responses. The perfect precision score of 100% assures that every action executed by the chatbot aligns precisely with the desired outcome.

These outstanding evaluation metrics underscore the effectiveness of your Rasa chatbot in facilitating seamless and accurate interactions with users. The ability to achieve such high accuracy and precision scores indicates that your chatbot can confidently handle user queries and generate appropriate responses with a high degree of accuracy.

Chapter 5

Impact on Environment

The integration of AI-based chatbots in university admissions has the potential to create a positive impact on the environment. By leveraging these technologies, educational institutions can contribute to multiple Sustainable Development Goals (SDGs) related to education, gender equality, decent work, innovation, reduced inequalities, and strong institutions. This chapter will explore in detail how the implementation of AI-based chatbots for university admission aligns with these SDGs, highlighting their environmental implications and benefits.

5.1 Quality Education (SDG 4)

AI chatbots in university admissions facilitate access to inclusive and equitable quality education, reducing the need for extensive physical resources and paperwork. By providing prospective students with instant and accurate information about courses, admission requirements, scholarships, and educational opportunities, these chatbots promote efficiency in the admission process, leading to resource optimization and reduced environmental impact.

5.2 Gender Equality (SDG 5)

In the pursuit of gender equality, AI-based chatbots can address disparities in higher education. By providing information about initiatives and programs that promote gender equality in admissions, scholarships, and campus life, chatbots foster an inclusive environment for all genders. This inclusivity helps create a

diverse student body, encouraging collaboration and innovation to solve environmental challenges.

5.3 Decent Work and Economic Growth (SDG 8)

AI chatbots contribute to decent work and economic growth by aligning students' skills and interests with the job market. These chatbots provide valuable insights into career prospects, internship opportunities, and industry trends. By equipping students with relevant information, they help optimize career choices, potentially leading to sustainable employment and economic stability, while reducing mismatches between graduates' skills and job market needs.

5.4 Industry, Innovation, and Infrastructure (SDG 9)

The integration of AI chatbots in university admissions demonstrates a commitment to promoting innovation and developing efficient infrastructure. By streamlining inquiries, managing application data, and enhancing the admission process's efficiency, chatbots optimize resource utilization, reduce administrative burdens, and minimize the environmental footprint associated with traditional admission procedures.

5.5 Reduced Inequalities (SDG 10)

AI chatbots bridge information gaps and reduce inequalities in access to education. These chatbots provide a virtual assistant that ensures equal access to information and support for all prospective students, regardless of their geographical location or socioeconomic background. This inclusivity empowers a diverse range of students to pursue higher education, contributing to a more equitable society and fostering environmentally conscious leaders.

5.6 Peace, Justice, and Strong Institutions (SDG 16)

AI chatbots strengthen transparency and accountability in university admissions processes. By providing clear information about admission criteria, selection procedures, and timelines, these chatbots foster trust and integrity. Transparent and accountable admissions systems promote a fair and just environment, enhancing the reputation of educational institutions and ensuring that decisions are made based on merit. This, in turn, supports the development of environmentally responsible practices within the institution.

Let's conclude all,

The integration of AI-based chatbots for university admissions has a multi-faceted impact on the environment, aligning with various SDGs. By leveraging these technologies, educational institutions can contribute to quality education, gender equality, decent work, innovation, reduced inequalities, and strong institutions, all of which have implications for environmental sustainability. The use of chatbots optimizes resource utilization, reduces administrative burdens, fosters inclusivity, and supports sustainable career choices. As educational institutions embrace AI-based chatbots, they demonstrate their commitment to creating a positive impact on the environment while advancing the SDGs.

Chapter 6

CONCLUSION

The development of a chatbot based on the RASA framework has provided a powerful tool for the University admission process. By leveraging the power of Artificial Intelligence (AI) and machine learning, the chatbot has been able to help 12th students stay updated on University admission activities. The RASA stack framework, which is built on top of Python and uses natural language processing (NLP), has enabled the chatbot to understand and respond to user queries in a more human-like manner.

RASA NLU (Natural Language Understanding) is a component of the RASA stack framework that is responsible for processing natural language input and extracting structured data. It is built on top of Python and uses machine learning algorithms to understand user input and classify it into intents and entities. This allows the chatbot to understand user queries and provide accurate responses.

RASA Core, on the other hand, is responsible for managing dialogue and conversation flow. It is also built on top of Python and uses machine learning algorithms to predict the next action to take based on the current conversation state. This allows the chatbot to have more natural and engaging conversations with users, as it can understand context and maintain the flow of the conversation.

In the development of the chatbot for University admission purposes, both RASA NLU and RASA Core were used to create a powerful and effective conversational agent. RASA NLU was used to process user input and extract intents and entities, while RASA Core was used to manage dialogue and conversation flow. The use of both components of the RASA stack framework allowed the chatbot to understand user queries and provide accurate and relevant responses, while maintaining a natural and engaging conversational flow.

The use of a knowledgeable database has allowed the chatbot to provide accurate

and relevant responses to user queries. The chatbot's ability to perform pattern matching and virtual assistance has made it possible to transform the user experience, making it more efficient and effective. With the help of the RASA stack framework, the chatbot has been able to reduce the workload on the University office staff, by automating the process of answering frequently asked questions. The chatbot has been designed to make conversation in English, providing a convenient and accessible way for students to get the information they need. The development of the chatbot involved the collection and preprocessing of a dataset, which was then used to train the RASA model. The interaction between the user and the chatbot was done at the command prompt level, providing a simple and intuitive interface for users to interact with the chatbot.

Overall the development of the RASA chatbot for University admission purposes has demonstrated the potential of AI and machine learning in transforming the user experience. The use of the RASA stack framework has enabled the chatbot to provide accurate and relevant responses to user queries, while reducing the workload on the University office staff. With further development and refinement, the chatbot has the potential to revolutionize the way universities interact with their students, providing a more efficient and effective means of communication.

Listing A.3: 'Stories.yml' Code

A.4 endpoints.yml

This file defines the endpoints that the Rasa server should connect to. It includes the configuration for the NLU and Core models, as well as any custom action servers. A.6.

```

1 # This file contains the different endpoints your bot can
2   use.
3
4 # Server where the models are pulled from.
5 # https://rasa.com/docs/rasa/model-storage#fetching-models
6   -from-a-server
7
8 #models:
9
10 #   url: http://my-server.com/models/default_core@latest
11 #   wait_time_between_pulls: 10    # [optional] (default:
12   100)
13
14 # Server which runs your custom actions.
15 # https://rasa.com/docs/rasa/custom-actions
16
17 #action_endpoint:
18 #   url: "http://localhost:5055/webhook"
19
20
21 # Tracker store which is used to store the conversations.
22 # By default the conversations are stored in memory.
23 # https://rasa.com/docs/rasa/tracker-stores

A.5 credentials.yml

This file contains the credentials required for the chatbot to connect and authenticate with external services, such as databases, APIs, or messaging platforms. It typically includes information such as usernames, passwords, access tokens, and other authentication details. A.6.

```

1 # This file contains the credentials for the voice & chat
2 #   platforms

```

```
2  # which your bot is using.
3  # https://rasa.com/docs/rasa/messaging-and-voice-channels
4
5 rest:
6  # # you don't need to provide anything here - this
7  # channel doesn't
8  # # require any credentials

Listing A.5: 'Credentials.yml' Code

A.6 rules.yml

This file contains rules that define the dialogue flow and behavior of the chatbot. Rules are used to create specific conversation paths and trigger actions based on user input or system conditions. They provide a way to define the chatbot's responses and actions in a more structured and deterministic manner compared to using machine learning models alone. A.6.

```

1 version: "3.1"
2
3 rules:
4
5 - rule: Say goodbye anytime the user says goodbye
6   steps:
7     - intent: goodbye
8     - action: utter_goodbye
9
10 - rule: Say 'I am a bot' anytime the user challenges
11   steps:
12     - intent: bot_challenge
13     - action: utter_iamabot
14

```

```
15  - rule: Handle fallback
16    steps:
17      - intent: fallback
18      - action: utter_default
```
